Anti-Skid or Anti-Slip Papers

Anti-Skid or Anti-Slip Papers

Sierra Coating Technologies LLC developed this lightweight, anti-slip tray liner to prevent plates and glasses from sliding during food service — it securely holds items on trays held at up to 40° angles, minimizing spillage and breakage. It is also printable to serve as a decorative element or promotional opportunity for the customer.

Our product development team chose 35 lb bond paper to use for this application based on its low cost, printability, and easy-to-coat properties. We tested a number of different coatings from a variety of vendors, and applied each to the paper in various weight formulations and with several different application patterns.

The tray liners produced from these trial runs were slide tested to evaluate their performance as well as print tested to assess the overall look and resolution.

Successful runs were further analyzed for material usage and speed of production to ensure a low overall cost for the product while still maintaining high quality. This anti-skid tray liner was delivered in 60" rolls, slit in 19.5" intervals, and packaged as a master roll with headers and plastic wrap.

Sierra® Coating is ready to manufacture anti-slip tray liners to meet the needs of your application. Coatings can be formulated based on application needs, and we can also custom cut sheets to your desired size and package them according to your needs.

To learn more about this project, read below, or contact Sierra Coating to learn how our anti-slip/anti-skid papers can help you with your application.

Anti-Skid or Anti-Slip Papers Project Highlights

Product Name Anti-Skid or Anti-Slip papers

Light weight papers with or without a pattern

coating of anti-skid

Coatings are soft as measured by a low t sub g

standard

Product is used for tray liners in the food service industry to prevent plates and glasses

from sliding during food service

Product Description

Find correct coating and pattern to meet a 40

degree slip angle

Project Scope Maintain printability of tray liner after

coating is applied

Test a number of coatings from different

vendors

Development Work Test patterns of application

Lower overall cost of product by reducing waste

and speed of production

Meet slide testing on standard test

Testing Needed Print test of coated product for look and

resolution

Set for multiple tests of coating

Trial Costs Test of 3 coating plates to achieve the best

pattern

Paper cost controlled by customer Raw Material Costs

Chemical for testing supplied by Sierra

Shipping Cost Shipping arranged by customer

Capabilities

Applied/Processes of

Aqueous Coatings in Roll to

Roll Process

Gravure application to cut rubber roll to

create pattern

Minimum slide angle of hold of 30 degrees Tightest Tolerance Paper 35 lbs. bond at 3000 sq. ft. ream Material Type

Coating specification of 0.3 lbs. dry for Material Thickness

pattern coat

Roll supplied at 2400 lbs. Product Length

Production widths from 60 inches Product Width

Rolls slit to width of 19.5 inches wide

Flotation Drying with Temperature settings 240° Temperature Range

Product defined to specific target

Material Finish Achieved by variations in coating and coating

weights

Standard is master roll with headers and Packaging

plastic wrap

Special Features Product can be pre- or post-printed

Secondary Operations Applied Custom sheets to size, prints and packaging

Majority of work goes on to be printed Industry for Use

Food Service

Volume Minimum volume production 20,000 lbs. per run

80,000 lbs. raw paper received for inventory

Delivery Time Product is made in two patterns and released

20,000 lbs. per order

Delivery Location Product is shipped from Green Bay, Wisconsin

Standards Met (Customer Products are made to customer supplied
